Street Group

Re: Senior Product Manager – SaaS

I am writing to apply for the Senior Product Manager role at Street Group. I have spent 15 years building and shipping technology products across blockchain infrastructure, developer platforms, and AI-augmented systems. My experience spans the full product lifecycle from discovery through to production operation, and I bring both the technical depth and commercial awareness this role requires.

Specific evidence mapped to your requirements:

- ▶ **B2B/SaaS product strategy with measurable commercial impact:** At Neuroware I owned the product roadmap for a B2B blockchain infrastructure platform. Grew from proof-of-concept to production deployment across multiple enterprise clients, directly driving revenue through API subscriptions and managed infrastructure services.
- ▶ **AI-driven strategy and integration:** Currently applying AI-augmented engineering methodology across all my work. Built autonomous agent orchestration systems (Researcher and Builder routines on cloud infrastructure) that manage multi-repository production pipelines. Shipped a complete game engine framework using LLM-augmented development at architecture quality in 16 days.
- ▶ **Stakeholder management across engineering, design, data and leadership:** As CTO and CBO across multiple companies, I have operated as the bridge between technical teams and business leadership. At Oviato I worked directly with DraperVC investors, legal counsel, and distributed engineering teams simultaneously. At Neuroware I managed relationships with the Securities Commission Malaysia while coordinating a 12-person engineering team across three countries.
- ▶ **Customer discovery and translating insights into priorities:** The Ordzaar product I prototyped became CakeDefi's fifth business vertical specifically because it was built from direct market observation of what NFT traders needed on Bitcoin. My protocol designs (DN-Key, Everstore) were adopted by regulated custody providers because I prioritised understanding their compliance constraints before writing code.
- ▶ **Autonomous working in fast-paced environments:** As a founder and solo technical leader, I operate with full autonomy by default. My recent Moddable project (535 commits, 16 days, four-layer architecture across six repositories) demonstrates the capacity to move at startup speed while maintaining production quality and strategic coherence.

What draws me to Street Group is the combination of AI-first product thinking within an established PropTech vertical. I understand the challenge of integrating AI capabilities into existing workflows without disrupting the value that customers already rely on. My experience building developer tools and platform infrastructure gives me a strong mental model for how AI workflows should be designed: as composable capabilities that augment human decision-making rather than replace it.

I am UK-based in West Yorkshire, immediately available, and comfortable with hybrid working in Manchester. I would welcome the opportunity to discuss how my product leadership and AI integration experience could contribute to the Cortex product area.
